Automated Shades:

Choosing the right control system

What are the differences between Bluetooth and app/hub based automation systems?

Bluetooth is the least complicated, most convenient automation option for shades. It is easy to install and pairs with existing Z-Wave and hub systems. It allows both in-home or local control—and it does not depend on a WiFi connection. Bluetooth capability comes **FREE** with all automated shades.

Purchasing and adding a hub will allow users to control shades from anywhere in the world.

Bali's motorized bottom up/top down cellular shades offer incredible ease, unsurpassed convenience, and precision light control.

Expansion Possibilities

Bluetooth technology allows your customers to expand their shade-control capabilities after their original purchase. By adding a hub, customers can use the Bali App to control, schedule, and monitor their shades from anywhere in the home or anywhere in the world.

Full-Home Automation

Using the Bali hub and app, your customers can integrate their shades into existing home-automation systems, including Google Assistant, Amazon Alexa, and SmartThings. Customers can start with simple Bluetooth operation and later purchase a hub to expand to a system that integrates their entire home into one, cohesive system.

Easy Installation

Bluetooth makes installing Bali automated shades a breeze. Your customers simply use their phones to set up their shades—quickly and easily.

Easy Control

Bluetooth allows your customers to control their automated shades using a phone, in much the same way that they would use a remote control. They don't have to worry about losing a remote—their phone is the remote control.

Impressive Bluetooth Capabilities

Bali automated shades allow your customers to set up routines using simply their phones—a capability unique to the technology Bali uses.
